

Strata

The deepest liquidity layer on Solana.
Real order book. Virtualized depth. Every trade fills.
Guaranteed.

3 layers

One unified book

100%

Fill guarantee

100%

Liquidity efficiency

SEED STAGE

Phizen & Team · stratabook.org

1/15

THE COLD START PROBLEM

Order books dominate global markets.
On-chain, they launch empty.

\$1.6T

Solana DEX volume in 2025

~\$100T

Global CLOB volume (stocks, forex, crypto CEXes)

0

Solana DEXes with real order book liquidity

THE CLOB PARADOX

Order books are the dominant exchange model across every asset class — NYSE, Nasdaq, Binance, Bybit. Traders demand visible depth, limit orders, and precise execution. But on-chain, CLOBs fail because of the cold start: empty books attract no traders, and no traders means no liquidity. It's a death spiral.

SOLANA'S MISSING PIECE

Solana is the #2 spot venue globally by volume — ahead of Coinbase, Bybit, and Bitget. Yet every attempt at an on-chain order book has failed. Phoenix is too thin. OpenBook has no depth. AMMs hide liquidity behind a single price. The volume is here. The infrastructure isn't.

THE SOLUTION

Three liquidity sources. One unified book.

- 1 Real Limit/Market Orders** User limit orders escrowed on-chain in UserVault PDAs. Hard commitment, trustless cancel. Standard order types: Limit, IOC, FOK, Post-Only. **PRIORITY**
- 2 Intent Orders** Market makers post intent on-chain — one deposit covers 50+ price levels. Speed + capital efficiency. Reputation-gated. Professional liquidity without capital lockup. **DEEP LIQUIDITY**
- 3 AVL — Aggregated Virtualized Liquidity** We sample Jupiter pools + on-chain AMM depth and virtualize it as tradeable depth on the book. Not cosmetic — you trade against it. Every pair is deep on day one. **GUARANTEED FILL**

Every taker order cascades through priority. AVL guarantees 100% fill. The book is never empty.

THE INNOVATION

AVL — Aggregated Virtualized Liquidity

We sample real liquidity from Jupiter pools and on-chain AMMs, then virtualize it as **tradeable depth** on the order book. Not a UI trick. Not a projection. You trade against this depth — atomic execution through CPI.

Deep on Day One

Any SPL pair with Jupiter liquidity is deep from the moment it's listed. No market makers. No bootstrapping period. No paid incentive programs. The liquidity already exists — we surface it.

Atomic CPI Execution

When a taker order hits AVL depth, it executes atomically through Jupiter CPI swaps. Price guard + slippage protection baked into the instruction. If execution price deviates, the trade reverts.

No Other DEX Has This

Phoenix shows their own liquidity only. Jupiter shows a swap price. No one aggregates and virtualizes external liquidity as visible, tradeable order book depth. This is a new primitive.

AVL is the cold start killer. Books that launch with deep, tradeable order books on every pair.

PROFESSIONAL LIQUIDITY

Intent Orders — Fill or Get Penalized

Market makers post intent directly on the order book. No vault. No deposit. Just a signed commitment to fill at a given spread. When a taker hits their level, they fill — or their reputation drops. Missed fills get penalized on-chain.

Post Intent. No Vault.

MMs post intent on-chain — a signed offer at a spread. No capital locked. No vault required. The book shows their depth immediately.

Reputation Penalties

Every missed fill is recorded on-chain. Reputation decays. Persistent non-fillers get deprioritized or removed. Honest MMs rise to the top.

Capital Efficiency

One intent covers the full quoted range. No capital locked per level. MMs can quote across dozens of pairs without tying up millions in vaults.

Professional liquidity without paid MM programs. Reputation enforces what rebates used to buy.

5/15

Built. Working. Trading.

Three-layer CLOB operational on Solana devnet. Real orders flowing. AVL depth visible. Live price feed.

- ✓ Three-layer order book — Real + Intent + AVL, segmented depth bars
- ✓ Order types — Limit, IOC, FOK, Post-Only
- ✓ Live price chart — lightweight-charts + Binance WebSocket ticker
- ✓ WebSocket feed — real-time depth updates, trade history
- ✓ Merkle root verification — zero-trust checkpointing on-chain

DEPTH NOBODY ELSE HAS

Only Strata shows the full liquidity picture.

	STRATA	JUPITER	PHOENIX	OPENBOOK	RAYDIUM
Visible order book depth	✓	✗	✓	✓	✗
AMM liquidity virtualized	✓	✗	✗	✗	✗
Deep day 1 – any pair	✓	✗	✗	✗	✗
Limit / Post-Only / IOC / FOK	✓	✗	✓	✓	✗
No paid MM required	✓	✗	✗	✗	✗
Self-custody	✓	✓	✓	✓	✓
100% fill guarantee	✓	✗	✗	✗	✗

Strata is the only venue on Solana that combines real order book UX with guaranteed depth on every pair. The combination is the moat.

YIELD-BEARING LIMIT ORDERS

Resting orders earn. Liquidity works while it waits.

THE FLYWHEEL

More yield → More liquidity parked → Deeper books → More volume → More yield

Two paths: **Perp funding capture** (1x SOL-PERP on Drift when rates are positive) or **money market deposits** (Kamino/Marginfi lending). Assets earn either way.

BETTING ON LIQUIDITY

The book becomes a yield surface. Capital bets where it earns.

Market Makers

Post intent across active pairs. Earn spread on fills + yield on idle capital. The deeper the book they quote, the more they earn. A direct incentive to provide liquidity where it's needed most.

Liquidity Providers

Park SOL in yield-bearing limit orders on high-volume pairs. Earn 15-20% APR while providing depth. Your resting order IS your yield position. Exit anytime — cancel and withdraw.

Traders

Trade against the deepest books on Solana. Tighter spreads from competition. Guaranteed fills from AVL. Better execution than any DEX — comparable to CEXes.

THE SELF-SUSTAINING CYCLE

Liquidity earns → More liquidity arrives → Books deepen → Traders come → Volume grows → Yield increases

THE PVP LAYER

Options. Prediction markets. MMs competing.

When the book has deep visible liquidity, entirely new instruments become possible — built directly on the order book infrastructure.

On-Chain Options

Buyer posts intent + premium. Solver locks full collateral. OptionRecord PDA is tradeable — secondary market from day one. Exercise is direct on-chain settlement. Solver earns yield on locked collateral while the option is live.

Prediction Markets

"Will there be >500 SOL of depth at \$150?" Bets on the book's own microstructure. More bets = more informed liquidity placement. The market predicts its own depth.

MM PvP Arena

Market makers compete on spread, speed, and reputation. Reputation scores determine RFQ priority. Options writers compete on premium. The book is the arena — Strata is the stadium.

Every piece of locked capital becomes a position. AVL ensures every trade fills. The line between trading and gaming dissolves. [We're the only team building toward this.](#)

MARKET

Order books are a \$5–15B/year fee market.
Solana is the fastest-growing slice.

\$1.6T

Solana DEX volume 2025

\$100T+

Global CLOB volume (CEXes + TradFi)

5%

Conservative volume capture target

\$80M+

Annual revenue at 10 bps avg fee

THE COMP — Binance spot: ~\$15B/day. Hyperliquid perps: \$2B/day → valued at ~\$10B+. They proved pro traders will leave CEXes for on-chain venues with real exchange UX.

Strata is the spot equivalent — bigger TAM, weaker incumbents, no on-chain CLOB peer. Plus MEV capture (Slide 13) adds a second revenue stream no competitor has.

ROADMAP

12 months. From devnet to full ecosystem.

NOW

Devnet Live

Three-layer CLOB working. Real Orders + AVL operational. Pro trading terminal complete.

Q3 2026

Mainnet Alpha

Audit complete. SOL/USDC + 5 majors deployed. Intent order layer active. First MM partners onboarded.

Q4 2026

Yield Layer

Yield-bearing limit orders live. Perp funding capture via Drift integration. Flywheel begins.

Q1 2027

Permissionless Pairs

Public pair creation. Token launch program. 60% creator fee revenue share. Long tail activation.

Q2 2027

PvP Layer

On-chain options + prediction markets. Full competitive arena. Book becomes a meta-game.

MEV CAPTURE

We control the spread. Protocol captures the value.

Order Matching MEV

The matcher is the sole crank. Every settle_trade batch is sequenced by Strata. We see the flow first.

Built-In, Not Bolted-On

MEV capture is part of the settle_trade instruction. The program validates every batch. We don't extract MEV — the protocol captures it.

Spread Capture

When a taker order hits AVL depth, the spread between the quoted Jupiter price and the executed price flows to the protocol vault.

Second Revenue Stream

Trading fees + MEV capture = two uncorrelated revenue sources from the same order flow. No other Solana DEX has this.

Protocol Vault

All MEV revenue accumulates in the ProtocolVault PDA. On-chain. Verifiable. This is protocol revenue — not a hidden tax.

Strata captures the value of its own order flow. Nobody else on Solana can do this.

TEAM

Two builders. One product. Shipping at 5–8x the pace of comparable teams.

P

Phizen

Product · Strategy · GTM

Drives product direction, market strategy, partnerships, and fundraising. Owns the vision from architecture to go-to-market.

A

AL

Engineering · Architecture · Execution

Full-stack engineering across Rust/Solana programs, matching engine, AVL depth sampler, and frontend. Owns the technical stack.

AI-Augmented Development. We run Overseer — a persistent AI agent that audits every commit, catches regressions, and monitors competitor moves 24/7. Agent-driven development is our force multiplier. Two people, 5–8x output.

THE ASK

Raising \$1M minimum. Building the liquidity layer Solana needs.

\$1M

MINIMUM RAISE

Engineering (2 senior hires)	\$400K	40%
Smart contract audits (2 firms)	\$200K	20%
MM onboarding + BD	\$150K	15%
Infra (RPC, indexers, API)	\$100K	10%
Operating runway	\$150K	15%

WHAT WE'RE LOOKING FOR

- ✓ Lead investor + room for strategic angels
- ✓ Solana DeFi advisors for MM introductions
- ✓ Connections to Wintermute, GSR, Flowdesk
- ✓ Token launch teams for permissionless pairs
- ✓ CEX relationships for liquidity partnerships
